

Document Integration for SAP®

ContentServer4Storage

SAP® Certified
Integration with SAP NetWeaver®

Archiving of documents is a major requirement in most SAP environments and plays an important role in many SAP projects.

Document archiving is not only a compliance need, it also supports the business. Clerks are able to retrieve any original document within the business context from the transactions they work with. Data Archiving is necessary for securing system performance by taking data in the SAP databases and storing it offline.

KGS ContentServer4Storage is SAP ArchiveLink™ 6.20, fully load tested and also SAP Netweaver Information Lifecycle Management (BC-ILM 2.0) certified.

KGS ContentServer4Storage has been especially developed to satisfy the requirements of SAP archiving. It is a unique solution in this field able to cope even with highest performance requirements.

There is no additional client software needed, as the entire system architecture is based on 100% SAP standards.

No additional roll outs are required. For document viewing the integrated document viewer is used. All users gain easily access to document management, as they stay in the context of the application they are used to.

Beside the deep integration into the SAP landscape the KGS ContentServer4Storage is also fully integrated into the different storage and HSM solutions.

Existing storage infrastructure will be used more efficiently. No special or proprietary hardware is needed for archiving.

KGS ContentServer4Storage server components are designed to run on any hardware and also on any operating system.
